ASX/Media Announcement – Mary Kathleen JV

25 October 2012

CYU and GSE update on high grade uranium in NW Queensland

- Following the Queensland government announcing on 22 October its lifting of the uranium mining ban, CYU has commenced a review of the uranium potential at its Elaine prospect.
- The Elaine prospect contains a previously released one metre intercept of **58,960ppm (>5%) uranium oxide (U_3O_8)** and 4,047ppm total rare earth oxides (TREO) from 508m. The intercept is within the previously released MKED009 of **30m @ 2,937ppm U_3O_8 , 6.7 g/t gold and 741 ppm molybdenum**.
- Uraninite confirmed as host mineral similar to neighboring Mary Kathleen uranium deposit that was mined until 1982.
- A review of all historic uranium assay results to date is underway.

Chinalco Yunnan Copper Resources Limited (CYU:ASX) and Goldsearch Limited (GSE:ASX) are pleased to provide an update on the Elaine prospect that forms part of the Mary Kathleen Joint Venture Project (**Figure 1**), Mt Isa, Queensland. CYU has a 70% interest in the joint venture and GSE 30%.

The main focus of the MKJV is to identify and develop commercial copper and gold resources within the MKJV leases and the Xstrata Copper Mt Frosty joint venture area.

Due to the significant presence of uranium, heavy and light rare earth elements and other minerals within the mineralized system it has been felt appropriate to release this update to inform shareholders of the potential that exists for in particular uranium and REE.

CYU Managing Director Jason Beckton said, “Exactly a year ago we announced to the market a high grade gold, uranium, REE core in drill hole MKED009 within the copper resource at Elaine. CYU is currently revisiting a separate uranium resource estimate to add to the peripheral uranium resource of 83,000 tonnes @ 280 ppm (0.028%) U_3O_8 and 3,200 ppm (0.32%) Total Rare Earth Oxides (TREO) at a lower cutoff of 200ppm U_3O_8 drilled by MKED001 to 003 in 2009.”

“The **Mary Kathleen mine historically was 9.5 Mt @ 1,300ppm U_3O_8** . When taken into consideration with the 12 km long belt that runs through the MKJV lease and the Mt Frosty joint venture lease area, the **Elaine drill intercept of 30m @ 2,937ppm U_3O_8** and other uranium assays to date give us great confidence in the potential for uranium and REE”.

All Elaine uranium drill results are tabulated below some having similar or higher grades to the historical and current producers average resource grades from operations at Mary Kathleen (1,300ppm), Olympic Dam (2,900ppm) and Ranger (1,000ppm).

*Cu equivalent calculations represent the total metal value for each metal, multiplied by the conversion factor, summed and expressed in equivalent copper percentage. These results are exploration results only and no allowances are made for recovery losses that may occur should mining eventually result. However it is the company's opinion that elements considered here have a reasonable potential to be recovered. Long-term price assumptions and copper equivalent conversion factors are summarised below: **Cu equivalent formula = Cu (%) + (Co (ppm) x 0.0004) + (Au (g/t) x 0.7239)**

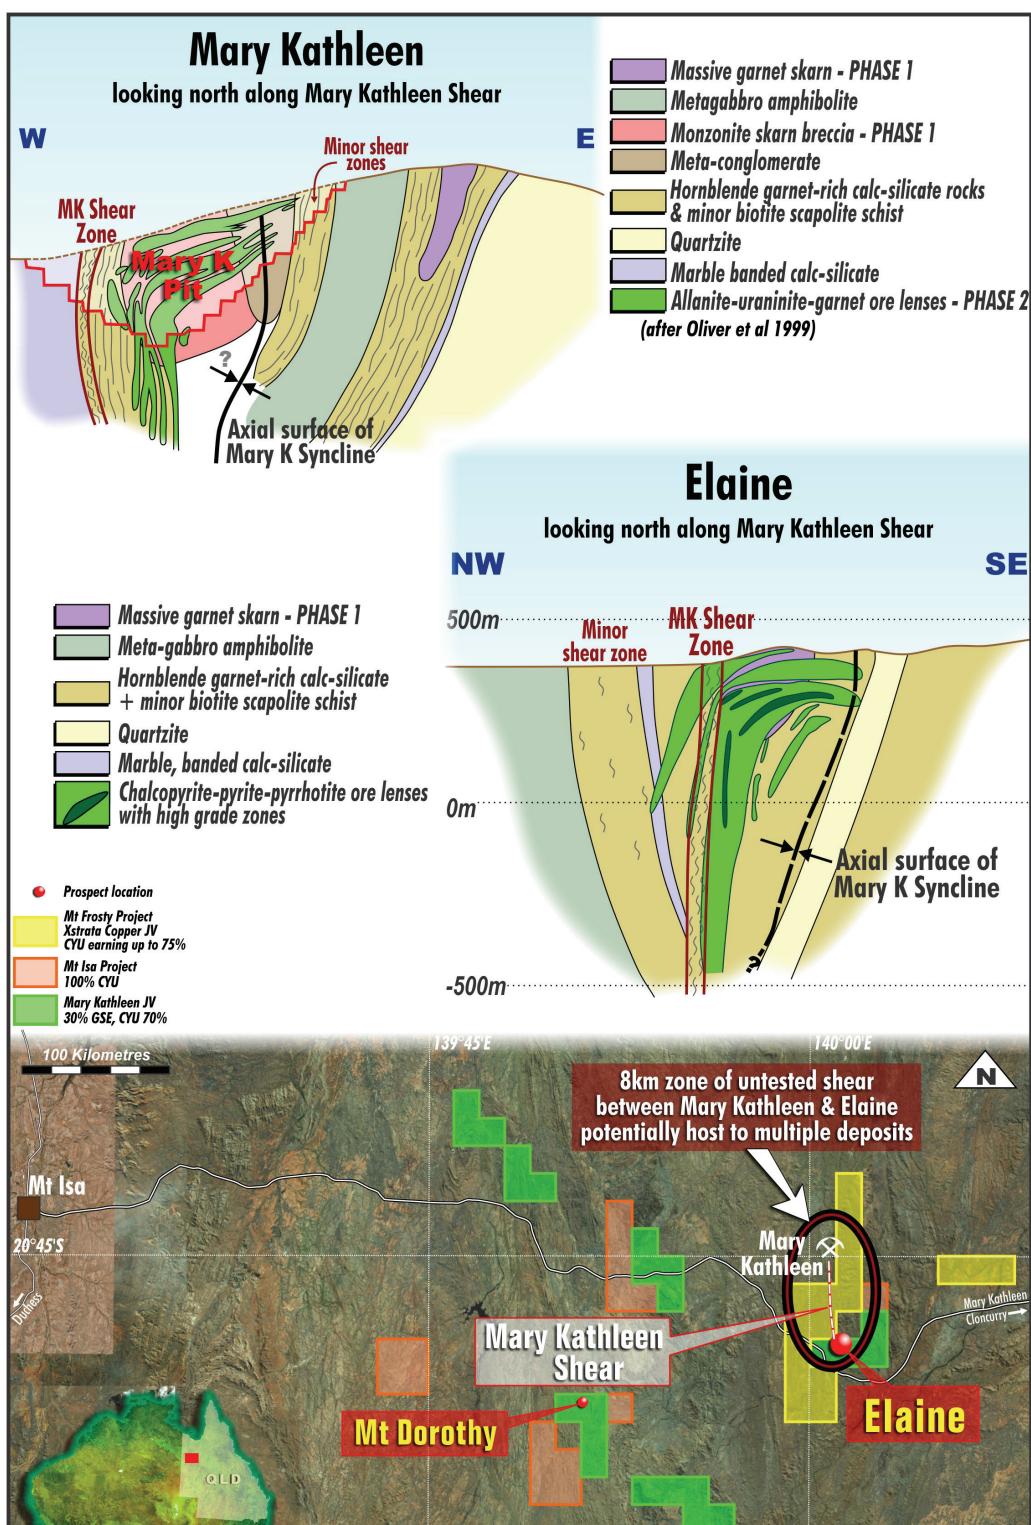

Figure 1. Historically the Mary Kathleen resource was 9.5Mt @ 1300ppm U₃O₈. With Elaine there are tabulated intercepts examples of similar or higher grade within the recently updated 27.7Mt Elaine JORC Inferred Resource.

Competent Person's Statements

The information regarding to the Inferred JORC Resource for Elaine 1 Uranium of 2010 and Exploration Activities on the Elaine Copper Prospect (EPM 14022) is based on information compiled by Jason Beckton, who is a Member of the Australian Institute of Geologists and is the Managing Director of Chinalco Yunnan Copper Resources Ltd. Mr Beckton has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity he is undertaking to qualify as a Competent Person as defined in the 2004 Edition of the "Australasian Code for Reporting of Exploration Results and Mineral Resources". Mr Beckton consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The information in this report that relates to the Inferred Copper/Gold Resource at the Elaine Project is based on information compiled by Steven Ristorcelli, who is a Certified Professional Geologist with the American Institute of Professional Geologists, a "Recognised Overseas Professional Organisation". Mr Ristorcelli is Principal Geologist with Mine Development Associates of Reno, Nevada, USA. Mr Ristorcelli has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity he is undertaking to qualify as a Competent Person as defined in the 2004 Edition of the "Australasian Code for Reporting of Exploration Results and Mineral Resources". Mr Ristorcelli consents to the inclusion in the report of the matters based on his information related to the Inferred resource in the form and context in which it appears.
